

# Yellow Penstemon

## *Penstemon confertus*

**Description:** Low-growing, spreading and mat-like. Produces many 6-12 in. flower stems with creamy white to pale yellow flowers. Blooms between May and August. Long, green, glossy leaves are mainly around the base.

**Habitat:** Grows in sunny meadows and wetlands at low to mid elevations. Tolerates most soil and moisture conditions.

**Landscape Uses:** Yellow penstemon is best suited to a wildflower meadow or perennial border in full sun or light shade. Do not surround with taller plants that will hide its subtle beauty. Though mat-forming, it is not really suited as a groundcover.
